

Programming Fundamentals – COC1071

Lab Plan – 05

Learning Objective:

■ Functions (Basics)

- 1) Write a function `isEven()` that prints whether the number is even or not. Take the number from the user. Call this function in `main()` to check if a number is even or odd.
- 2) Write a function `max()` that prints max number between two numbers input by the user. Use this function in `main()` to find and display the maximum of two numbers.
- 3) Write a function `factorial()` that calculates the factorial of a positive integer. Call the function in `main()` and display the result.
- 4) Write a function `power()` that takes two integers from the user, base and exponent, and prints base raised to the power of exponent. Call this function in `main()` and display the result.
- 5) Write a function `sumOfDigits()` that takes an integer from the user and prints the sum of its digits. Call this function in `main()` and display the result.
- 6) Write a function `reverseNumber()` that takes an integer from the user and prints the number with its digits reversed. Call this function in `main()`.
- 7) Write a function `isPalindrome()` that takes a number from the user and prints whether the number is palindrome or not. Call the function in `main()`.
- 8) Write a function `celsiusToFahrenheit()` that takes a temperature in Celsius from the user and prints the equivalent Fahrenheit temperature. Call the function in `main()`.
- 9) Write a function `isVowel()` that takes a character from the user and prints whether is entered character is a vowel (a, e, i, o, u), or not. Call this function in `main()`.
- 10) Write a function `countDigits()` that takes an integer from the user and prints the number of digits in the integer. Call this function in `main()`.
